

Abstract

Telecommunication terminal

A telecommunication terminal, in particular a mobile telephone or cordless telephone, has an external signaling apparatus (3) connected to the telecommunication terminal (1) by means of cordless communication for the purpose of silent call signaling by means of vibration signal or visual signal. The separate signaling apparatus (3), which may be much smaller than the mobile telephone itself, can be carried comfortably on the body of the user, who is thus easily able to detect a silent vibrating alarm.
